How do I choose a wind turbine generator?

Generally speaking, wind turbine generators can be selected from commercially available electrical machines with or without minor modifications. If a wind turbine design is required to match a specific site, some key issues should be taken into account. These include: Capital cost and maintenance.

How to optimize a wind turbine generator?

One of key components in the wind turbine is its drive train, which links aerodynamic rotor and electrical output terminals. Optimization of wind turbine generators can not be realized without considering mechanical, structural, hydraulic and magnetic performance of the drive train.

How will wind energy penetration change in 2035?

In the global electricity market, wind energy penetration is projected to rise from 1% in 2008 to 8% in 2035. This is achieved simply by developing larger wind turbines and employing more in the wind farm. In terms of the size, large wind turbines of the MW order began to appear in the EU, the US and now in China and India.

How does a HAWT generator work?

These blades are affixed to a rotor, which, when propelled by the wind, causes a shaft to rotate. This shaft is connected to a generator that transforms the kinetic energy of rotation into electrical energy. Modern HAWTs have evolved to larger scales and are now capable of generating power in the multi-megawatt range [3,4,5].

Can vortex generators be used in large-scale wind turbines?

Conclusions and future research directions for VGs used in large-scale wind turbines. The aerodynamic performance of newly planned as well as existing wind turbines can be improved by eliminating stall. Vortex generators (VGs) can effectively delay air separation occurring on the inboard-section of the wind turbine blade.

How has CFD changed the design of a wind turbine?

Nevertheless, advancements in computing power have enabled more CFD studies on DAWTs, with a specific focus on blade and shroud design. Phillips played a key role in optimizing the design and performance of DAWTs through the use of CFD methods in which the wind turbine was modeled as an actuator disk.
