

Do DFIG wind turbines fail?

A comparison of failures carried out on Chinese onshore DFIG wind turbine installations, corresponding to 80% of the sample and PMSG, equivalent to 20% of the sample, assesses failures over the life cycle after their initial operation.

Do model-based fault detection and fault-tolerant control schemes improve wind turbine reliability?

The authors in comprehensively review the state-of-the-art model-based fault detection and fault-tolerant control schemes for wind turbine generation, focusing on their advantages, capabilities, and limitations, to provide a suitable reference for further research on wind turbine reliability improvement.

Are signal processing methods used for condition monitoring & fault diagnosis of wind turbines?

A comprehensive review on signals and signal processing methods used for condition monitoring and fault diagnosis of wind turbines is presented in survey (Qiao and Member, 2015b). Many surveys on fault diagnosis methods for converter have been published, and several reviews are compared in Table 1.

How can artificial intelligence improve the accuracy of generator fault detection?

Then for generator faults, based on artificial intelligence algorithm design (FD) algorithm, to improve the accuracy of fault detection and location. The combination of shallow feature extraction and deep feature extraction methods is more effective and efficient in the field of FD. As shown in Figure 17.

How can real-time detection and diagnosis be carried out on a generator?

Aiming at the problems of "over-maintenance" and "under-maintenance", real-time detection and diagnosis [17, 18] could be carried out on the generator, to reduce the frequency of faults and the loss caused to the generator and prolong the service life of the generator.
