

# History of China's wind power generation

Does China have wind power generation?

Wind power generation has increased rapidly in China over the last decade. In this paper the authors present an extensive survey on the status and development of wind power generation in China. The wind resource distributions in China are presented and assessed, and the 10 GW-scale wind power generation bases are introduced in details.

When did China start developing wind power?

In 1995, China promulgated the outline of new energy and renewable energy development, which can be seen as a turning point for China's wind power industry. From 1995 to 2006, wind power began to keep a relatively rapid development so-called industrialization exploration stage.

What is China's first wind farm?

In 1986, China's first wind farm - Malan wind farm in Rongcheng, Shandong Province, is a milestone in the history of China's wind power, from which China's wind power is really in its development stage. However, in the early demonstration stage, the scale of China's wind power is very small.

When was the first wind generator made in China?

1997: The Institute of Measurement and Control of Rotating Machinery and Wind Energy Devices is jointly established by the Northwestern Polytechnical University and the Berlin Polytechnic University. June 1998: The first wind-driven generator made in China is linked to the grid in the Xinjiang Uygur autonomous region.

Why is wind power growing rapidly in China?

At the same time, the rapid increase of installed capacity has also promoted the manufacturing industry of wind turbines to increase rapidly in China; from 2003, the localization rate and the unit capacity have been growing rapidly. Wind power in China has great potential.

When did China start manufacturing wind turbines?

Domestic manufacturing was still at an early stage, with only a few Chinese companies, such as Goldwind, operating in the market. In the initial demonstration period (1986-1993), the main activity was building small-scale demonstration wind farms using grants from foreign donor countries and loans.

Although the coastal areas are very rich in wind energy resources, for technical, geographical, and economic reasons, the proportion of offshore wind power in China's wind power generation is relatively small and ...

In 2009, China introduced a feed-in tariff for wind power generation, which applies for the entire operational period (usually 20 years) of a wind farm. There are four different tariff categories, ...

In this chapter, sociopolitical economic influences on wind power development will be examined with an

# History of China s wind power generation

intention to try to explain China"s remarkable recent achievements in wind power. The ...

After the analysis of history and the running data, the local power forecasting results of the wind farm are uploaded to the dispatching master station. ... This paper ...
