

How large-scale energy storage should be configured for new energy

Does a new power system need long-term energy storage?

According to the analysis of the necessity of long-term energy storage, the main position of hydrogen energy in the new power system is determined as a large-scale seasonal regulation resource.

Why is long-term energy storage a key component in building a new power system?

Therefore, long-term energy storage technology will become a key component in building a new power system. When the penetration rate of new energy is low, only short-term energy storage is needed to provide power-regulation capacity for the system and improve the utilization rate of new energy.

What characteristics should energy storage have for each grid service?

Energy reserve, power reserve and technical characteristics that energy storage should have for each grid service according to the analysed grid codes and literature. Limit power output. Avoid congestions. Increase power output. Limit frequency deviations. Depends on droop dead-band and the network's strength. Decrease power output.

Which energy storage options should be used in future grid codes?

While flow batteries could be an alternative option, Lithium-Ion or flywheel energy storage could also be used, specially in those particular cases where very high power is required (e.g. very large photovoltaic power plants). Black start is also one of the candidates to be required in the future grid codes.

Why do we need a co-optimized energy storage system?

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future.

Why are energy storage technologies becoming a part of electrical power system?

The reliability and efficiency enhancement of energy storage (ES) technologies, together with their cost are leading to their increasing participation in the electrical power system.
