

What is a photovoltaic (PV) cell?

A photovoltaic (PV) cell,commonly called a solar cell,is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons,or particles of solar energy.

How does photovoltaic (PV) technology work?

Photovoltaic (PV) materials and devices convert sunlight into electrical energy. What is photovoltaic (PV) technology and how does it work? PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell. An individual PV cell is usually small,typically producing about 1 or 2 watts of power.

What is solar energy?

Solar energy is the conversion of sunlight into usable energy forms. Solar photovoltaics (PV), solar thermal electricity and solar heating and cooling are well established solar technologies.

What are new photovoltaic technologies?

Solar cell researchers at NREL and elsewhere are also pursuing many new photovoltaic technologies--such as solar cells made from organic materials,quantum dots,and hybrid organic-inorganic materials(also known as perovskites). These next-generation technologies may offer lower costs,greater ease of manufacture,or other benefits.

How do solar panels generate electricity?

Photovoltaic (PV) technologies - more commonly known as solar panels - generate power using devices that absorb energy from sunlightand convert it into electrical energy through semiconducting materials. These devices, known as solar cells, are then connected to form larger power-generating units known as modules or panels.

How efficient is a solar PV system?

Experimental PV cells and PV cells for niche markets, such as space satellites, have achieved nearly 50% efficiency. When the sun is shining, PV systems can generate electricity to directly power devices such as water pumps or supply electric power grids.
