

Microgrid connected to the grid to reduce peak loads and fill valleys

What happens if a microgrid is grid-connected?

If the microgrid is grid-connected (i.e., connected to the main electric grid), then the community can draw power from the main electric grid to supplement its own generation as needed or sell power back to the main electric grid when it is generating excess power.

What is a microgrid?

The term "microgrid" refers to the concept of a small number of DERs connected to a single power subsystem. DERs include both renewable and /or conventional resources . The electric grid is no longer a one-way system from the 20th-century . A constellation of distributed energy technologies is paving the way for MGs ".

What happens when a microgrid loses power?

When the main electric grid loses power, the microgrid goes into island mode (i.e., operates independently of the main electric grid) and serves its own customers with the generation and other DERs (i.e., batteries or vehicle-to-grid electric vehicles) operating within the microgrid.

Is there a predictive control scheme for building integrated microgrids?

The novelty of the proposed paper may be summarized in providing a comprehensive predictive control scheme for building integrated microgrid, where the objective is the peak load reduction/shaving taking advantages of V2B concept and operational flexibilities of electric vehicles, and coping with uncertainties of solar irradiation and loads.

Does a microgrid shave peak load during the day?

It can be seen that the microgrid succeed to shave the total peak load during the day. The analysis shows that 75% of the total peak load has been fulfilled by the PV production,18% represents the total contribution of the EVs,while 7% constitutes the input of the energy storage system.

Can microgrids improve energy resilience?

Since microgrids are not the only way to enhance energy resilience, communities may want to consider alternate resilience investment options, including hardening existing transmission and distribution systems, weatherizing power generation sources, and building additional distribution systems to provide energy supply redundancy.
