How much does a microgrid cost?

The analysis shows that controller costs per megawatt range from \$6,200/MW to \$470,000/MW, excluding outliers, with a mean of \$155,000/MW for the microgrids in the database. In total, controller cost data was available for 21 microgrids out of a total of 80 projects in the Phase I Microgrid Cost Study by NREL.

What is the DOE's microgrid cost study?

The U.S. Department of Energy's (DOE's) microgrid cost study is identifying the costs of components, integration, and installation of U.S. microgrids; project cost improvements; and technical accelerators during the next 5 years and beyond.

How much does energy storage cost a microgrid?

In commercial and industrial microgrids, energy storage represents 15% and 25% of the total costs per megawatt, respectively. In commercial microgrids, soft costs account for 43%, while in community microgrids they account for 24%.

Are microgrids a good investment?

Microgrids that incorporate renewable energy resources can have environmental benefits in terms of reduced greenhouse gas emissions and air pollutants. In some cases, microgrids can sell power back to the grid during normal operations. Depending on the complexity, microgrids can have high upfront capital costs.

How much new generation is needed for microgrids?

On average, 64% new generation is called for in the winners of the Stage 1 competition. This is slightly less than the average of 71% new generation for microgrids in the community segment in the NREL cost database.

What is the final microgrid Study Cost Study Database?

The final microgrid study database consists of 80 entries and is described in terms of geographical location, DER capacity, and number of projects. It is compared to microgrid market reporting by Navigant Research and GTM.

Cost depends on where and why the microgrid is built and what kind of generation it uses. Nanogrids can cost in the tens of thousands while a highly complex urban microgrid planned for Cleveland has an estimated \$100
