How do inverters affect a grid-connected PV system?

For a grid-connected PV system, inverters are the crucial part required to convert dc power from solar arrays to ac power transported into the power grid. The control performance and stability of inverters severely affect the PV system, and lots of works have explored how to analyze and improve PV inverters' control stability.

How do PV inverters control stability?

The control performance and stability of inverters severely affect the PV system, and lots of works have explored how to analyze and improve PV inverters' control stability. In general, PV inverters' control can be typically divided into constant power control, constant voltage and frequency control, droop control, etc.

What is the control performance of PV inverters?

The control performance of PV inverters determines the system's stability and reliability. Conventional control is the foundation for intelligent optimization of grid-connected PV systems. Therefore, a brief overview of these typical controls should be given to lay the theoretical foundation of further contents.

How do PV inverters work?

Traditionally, PV inverters work in grid-following mode to output the maximum amount of power by controlling the output current. However, grid-forming inverters can support system voltage and frequency and play an important role in weak power grids. Inverters with two operation modes are attracting more attention.

What is constant power control in a PV inverter?

In general, PV inverters' control can be typically divided into constant power control, constant voltage and frequency control, droop control, etc. Of these, constant power control is primarily utilized in grid-connected inverters to control the active and reactive power generated by the PV system.

How can ANN control a PV inverter?

Figure 12 shows the control of the PV inverters with ANN, in which the internal current control loop is realized by a neural network. The current reference is generated by an external power loop, and the ANN controller adjusts the actual feedback current to follow the reference current. Figure 12.
