What is a standard test condition for a photovoltaic solar panel?

The standard test conditions, or STC of a photovoltaic solar panel is used by a manufacturer as a way to define the electrical performance and characteristics of their photovoltaic panels and modules. We know that photovoltaic (PV) panels and modules are semiconductor devices that generate an electrical output when exposed directly to sunlight.

Do solar panels need a set of test conditions?

In the case of PV cells and solar panels, we needed to devise a set of test conditions all solar panels should be tested at. That's why the world's regulatory authority on electrical and electronic devices - the International Electrotechnical Commission or IEC - proposed the first set of test conditions in a 1993 outline.

What is the power rating of a photovoltaic panel?

For example, 100 WDC. This power rating and therefore the performance of a photovoltaic panel is presented according to defined international testing criteria. Known as (STC). Then when a panel is advertised as having a capacity of say, 400 Watts-peak, this is the power output it will produce under STC conditions.

What are solar panel power ratings & voltages?

This chart tells us that all those solar panel power ratings, voltages, and currents are measured at: Solar irradiance of 1,000 W/m². In the real world, we get 0 W/m² at night and up to about 1,500 W/m² on a very sunny day without clouds. Cell temperature is held constant at 25°C (77°F). Air mass coefficient is 1.5.

What is open circuit voltage?

The open circuit voltage is the maximum voltage that the solar panel can produce with no load on it (i.e. measured with a multimeter across the open ends of the wires attached to the panel). If two or more panels are wired in series it will be $V_{oc} \text{ of panel 1} + V_{oc} \text{ of panel 2, etc.}$

What are nominal operating conditions (NOC) of a photovoltaic panel?

Nominal Operating Conditions (NOC) of a photovoltaic panel is a set of common reference conditions designed to simulate the panel for actual outdoor measurements. They try to combine the irradiance level of a clear summer day, with a panel temperature of a clear winter day and the light spectrum of a clear spring day.
