

How does a photovoltaic cell work?

**Photovoltaic Cell Defined:** A photovoltaic cell, also known as a solar cell, is defined as a device that converts light into electricity using the photovoltaic effect. **Working Principle:** The solar cell working principle involves converting light energy into electrical energy by separating light-induced charge carriers within a semiconductor.

What is photovoltaic effect?

This interaction between sunlight and solar cells is termed the photovoltaic effect. The phenomenon was discovered by Edmond Becquerel in 1839. When we close the circuit by connecting the upper and rear end of the solar cell, the excited electrons flow into the circuit. The diagram below depicts the same. Simple working of a solar cell

Which material is used for constructing a photovoltaic cell?

Silicon is the most widely used semiconductor material for constructing the photovoltaic cell. The silicon atom has four valence electrons. In a solid crystal, each silicon atom shares each of its four valence electrons with another nearest silicon atom hence creating covalent bonds between them.

What are the advantages and disadvantages of a photovoltaic cell?

Following are the advantages and disadvantages of a photovoltaic cell. **Advantages** Low maintenance costs. It is a renewable energy source and easily available. They have a lower risk for the loss of efficiency and can be used for a longer time period. **Disadvantages** Noise pollution.
