

How machine vision is used in photovoltaic panel defect detection?

Machine vision-based approaches have become an important direction in the field of defect detection. Many researchers have proposed different algorithms 11, 15, 16 for photovoltaic panel defect detection by creating their own datasets.

Can EL images be used for photovoltaic panel defect detection?

Buerhop et al. 17 constructed a publicly available dataset using EL images for optical inspection of photovoltaic panels. Based on this dataset, researchers have developed numerous algorithms 9, 10, 12 for photovoltaic panel defect detection.

What is PVL-AD dataset for photovoltaic panel defect detection?

To meet the data requirements, Su et al. 18 proposed PVEL-AD dataset for photovoltaic panel defect detection and conducted several subsequent studies 19, 20, 21 based on this dataset. In recent years, the PVEL-AD dataset has become a benchmark for photovoltaic (PV) cell defect detection research using electroluminescence (EL) images.

How can deep learning improve photovoltaic panel defect detection?

Based on this dataset, researchers have developed numerous algorithms 9, 10, 12 for photovoltaic panel defect detection. Deep learning, compared to traditional machine learning, has powerful feature extraction capabilities, thus exhibiting better robustness and generalization.

Can a real-time defect detection model detect photovoltaic panels?

Efforts have been made to develop models capable of real-time defect detection, with some achieving impressive accuracy and processing speeds. However, existing approaches often struggle with feature redundancy and inefficient representations of defects in photovoltaic panels.

Is Yolo-ACF a good choice for defect detection on photovoltaic panels?

Through qualitative and quantitative comparisons with various alternative methods, we demonstrate that our YOLO-ACF strikes a good balance between detection performance, model complexity, and detection speed for defect detection on photovoltaic panels. Moreover, it demonstrates remarkable versatility across a spectrum of defect types.

Photovoltaic (PV) cell defect detection has become a prominent problem in the development of the PV industry; however, the entire industry lacks effective technical means. In this paper, we propose a deep ...

In this study, we present an innovative Ag/Porous Silicon (PS)/p-Si structure that demonstrates a remarkable lateral photovoltaic effect, rendering it highly suitable for sensitive ...

Photovoltaic (PV) panels are widely adopted and set up on residential rooftops and photovoltaic power plants. However, long-term exposure to ultraviolet rays, high temperature and humid environments accelerates the ...

thin-film PV modules (CdTe and CIGS) is thoroughly analyzed, and a comprehensive catalogue of defects is established. For crystalline silicon devices, cell breakages resulting from micro ...

By recycling silicon from end-of-life PV panels, thousands of tons of silicon... One cannot claim solar panels to be recyclable, in a circular economy sense, until scientists find a ...

We introduce a machine learning framework to establish photoluminescence (PL) imaging as an optical inspection technique for the detection of cracks in multi-crystalline silicon ...

High-performance photodetectors with integration potential for imaging are desired in deep ultraviolet (DUV) detection, such as space communication, solar storm observation and atmosphere monitoring [1, 2, 3].

The past two decades have seen an increase in the deployment of photovoltaic installations as nations around the world try to play their part in dampening the impacts of ...
