

# Requirements for microgrid connection

What are the requirements for a microgrid?

A microgrid, once isolated, shall operate in accordance with the requirements of IEEE-1547, particularly when Company-owned equipment and assets are included in the islanded configuration. The voltage shall be maintained in accordance with the Company service specification EO-2065.

How do you calculate power requirements for a microgrid?

The best way to estimate the future power requirements of the microgrid is to analyze or record data for the specific loads and introduce a contingency above the peak load.<sup>15</sup> Other key considerations for understanding loads include power factor and system harmonics caused by nonlinear loads. See Appendix B for details on these considerations.

Can a microgrid connect and disconnect from the grid?

A microgrid can connect and disconnect from the grid to enable it to operate in both grid-connected or island mode." P.K. Singh "Technical and Economic Potential of Microgrid in California", Humboldt State University, 2017. Generation Controller (BMS, Diesel Control, et.)

Can a microgrid supply enough power?

A microgrid must be able to supply enough generation to match electrical load requirements at all times. Evaluating existing on-site generation options (e.g., on-site PV, energy storage, cogeneration, and back-up generators) is the first step in developing a strategy for the microgrid to power loads.

How much construction is required for a microgrid project?

The level of construction for a microgrid project will vary considerably depending on the amount of new infrastructure required. If a lot of new infrastructure such as generation equipment, communications lines, and electrical equipment is required, the construction process can be quite long and involved.

What information should be included in a microgrid project?

The key data includes electrical drawings, information on critical loads, utility load information, and utility cost information. Once the background information has been reviewed, the project team should begin initial stakeholder consultations. Implementing a successful microgrid requires participation by many stakeholders.
