What is a hot water storage system?

A typical hot water storage system consists of a water tank to store thermal energy, heat exchangers to transfer energy from different heat sources, and a pipe network to circulate water.

What is a heat exchanger in a storage tank?

First there is the heat exchanger between the collector and storage tank I for any fluid other than water, and there is the other heat exchanger between storage tanks I and II with forced circulation. There is water in storage tank II. Such a system is required when the temperature of frozen water goes into negative numbers.

What is thermal stratification in a hot water storage tank?

A hot water storage tank with three heating sources is investigated. Thermal stratification is evaluated in three dynamic operational modes. Stratification number ( $Str$ ) and Richardson number ( $Ri$ ) are used to quantify the degree of stratification. Maximum thermal stratification is achieved with heating source in the upper portion of tank.

What are the boundary conditions of a hot water storage tank?

Tank walls, heat exchanger coil surface and stratifier wall are provided with the no-slip boundary conditions. Usually the domestic size hot water storage tanks are well insulated with a thick layer of insulation material of very low thermal conductivity due to which the effect of heat losses on the quality of stratification is considered low.

How does a solar storage tank work?

The first coiled heat exchanger HE I, located at the upper part of the tank, is connected with the solar flat plate collector. The hot water is circulating through the flat plate collector by the thermosyphon effect to heat the cold water inside the storage tank.

Can a hot water storage tank be installed on hot water?

This diagram shows an instantaneous water heater system with a hot water storage tank. The expansion tank is typically installed on the cold water inlet but can be installed on the hot water supply after the water heater. A building recirculation line is an option to assist in preheating water flowing to the storage tank.
