Should I install solar panels on my roof?

Solar installation is complex, and you don't want to jeopardize such a costly investment. Take the time to properly think through and set up your project before beginning. First, check that your property is suitable for a solar power system. Your roof needs to have enough surface area for the panels required to supply your energy needs.

Should you choose a solar photovoltaic system?

Solar photovoltaic (PV) systems have become an increasingly popular choice for those looking to reduce their carbon footprint and save money on energy bills. Before choosing a new system, homeowners should know how a roof can impact options, the best ways to connect the panels, and more.

Can solar panels be installed on a south-facing roof?

For homes in the Northern Hemisphere, a shade-free, south-facing roof with solar panels placed at a 30-degree tilt is ideal for production. This is not to say that having a roof that is partially shaded, or east- or west-facing, puts a solar PV system out of the question.

What is a roof-mounted solar panel installation?

Roof-mount solar panel installations are less intrusive and invasive, and there is no need for extensive pre- and post-installation work or construction. Roof-mounted solar panels add aesthetic appeal and blend seamlessly with roofs, making them ideal for residential rooftop surfaces.

Can you install ground-mounted solar panels on a pitched roof?

You can install ground-mounted solar panels, though you'll again need more space than you would if you installed panels on a pitched roof. This is because you'll need to space out your panels so they don't cast shade on each other, just like on a flat roof.

Can a flat roof be used for solar panels?

Shading: Excessive shade from trees or nearby structures can significantly reduce solar energy production. Slope: A 15-40 degree slope is ideal for solar panels, but flat roofs can also be suitable with proper mounting systems.
