

What is the potential of solar PV power generation in Xinjiang?

(3) In the situation where the construction of PV power plants in Xinjiang is fully developed, the theoretical potential of annual solar PV power generation in Xinjiang is approximately 8.57×10^6 GWh. This is equivalent to 2.59×10^9 tce of coal. Furthermore, 6.58×10^9 t of CO₂ emissions can be reduced.

Where does PV power come from in China?

However, most of the PV potential in China is distributed in sparsely populated regions such as northwest and Tibet of China, and more than 95% of PV power generation in these areas is centralized PV power generation.

Where is PV power generation mainly concentrated in Xinjiang & Inner Mongolia?

In terms of provinces, PV potential is mainly concentrated in Xinjiang, Inner Mongolia, Qinghai, and other provinces west of the Hu Huanyong Line (Population Distribution Line). The PV power generation potential of the provinces east of this line basically does not exceed 3 PWh, and most of them do not exceed 1 PWh.

Why is it important to assess photovoltaic power generation potential in China?

Clear spatial dislocations between PV power generation potential and population distribution and electricity demand. Accurate assessment of the photovoltaic (PV) power generation potential in China is important for the reduction of carbon emission intensity and the achievement of the goal of Carbon Neutral.

Can Xinjiang meet its annual electricity demand?

Therefore, a progress level of 25% in Xinjiang was fully capable of satisfying Xinjiang's annual electricity demand. In terms of PV power generation, 2.14×10^6 GWh of PV power generation is equivalent to 6.48×10^8 tce of coal combustion for coal-fired power generation.

Does Xinjiang have power generation potential?

PV power generation potential is approximately 27 times the energy consumption of Xinjiang in 2020. Through the suitability assessment and calculations, we found that Xinjiang has significant potential for PV systems.

1. Introduction

The traditional photovoltaic power forecasting model has the problems of low forecast accuracy and hysteresis. To further improve the prediction accuracy of PV power, this ...

This new dataset is expected to be conducive to policy management, environmental assessment, and further classification of PV power plants. The dataset of photovoltaic power plant distribution in ...

The contribution of power production by photovoltaic (PV) systems to the electricity supply is constantly

increasing. An efficient use of the fluctuating solar power production will highly benefit ...

A comprehensive assessment method and some suitable indicators for Xinjiang are the focus of this suitability assessment of Xinjiang's PV power generation. As a region with rich fossil fuel energy resources, Xinjiang's ...

A hybrid deep learning approach based on convolutional neural network and long-short term memory recurrent neural network for the PV output power forecasting is proposed and results ...

URUMQI, Dec. 30 (Xinhua) -- Rich in sunshine, Xinjiang Uygur Autonomous Region is significant in China's solar power generation. Besides increasing the installation and grid connection of ...

thin-film cells, third-generation organic solar cells, and dye-sensitized solar cells, among others [17, 18]. It has been reported that photovoltaic power could contribute significantly to emission ...
